# RDF and RDB 2 D2RQ

### D2RQ showed the way

- Early system to expose relational data as RDF
  - See <a href="http://d2rq.org/">http://d2rq.org/</a>
  - Open source: <a href="https://github.com/d2rq/d2rq">https://github.com/d2rq/d2rq</a>
  - Still widely used
- Lets you
  - Query a non-RDF database using SPARQL
  - Access database content as linked data over Web
  - Dump database content in RDF formats
  - Access non-RDF database using Apache Jena API

### D2RQ

- D2RQ mapping language file describes relation between ontology & RDB
- D2R server provides
   HTML & linked data views
   & SPARQL endpoint
- D2RQ engine uses mappings to rewrite Jena &
   Sesame API calls to SQL queries & generates RDF dumps in various formats

### **D2RQ Features**

- Browsing database contents: Web interface for navigation through the RDF contents for people
- Resolvable URIs: D2R Server assigns a resolvable URI to each entity in the database
- Content negotiation: HTML & RDF versions share URIs; HTTP content negotiation fixes version
- SPARQL: Both an endpoint and explorer provided
- BLOBs and CLOBs: Support for serving up values as files (e.g., PDFs, images)
- Not surprisingly, no inferencing

### **D2RQ Mapping Language**

- The mapping is defined in RDF
- D2RQ generates a default map using a standard heuristic:
  - Each DB table has infor. about one type of thing
  - Each table row represents one object
  - First column is key => defines the object
  - Other columns represent properties
- Edit default mapping or create your own

### Let's do it

- Need: relational DBMS, Java, Web server
- Clone or download D2RQ git repo
- Compile with: ant jar
  - Install java and ant as needed
- Create default mapping from a database
- Start D2RQ server on a port
  - Send it SPARQL queries
  - Access it via html

### A simple database

#### Load lab.sql into mysql

```
mysql —u demo —p demo
mysql> show databases;
 Database
 information schema
 mysql
performance schema
 sys
4 rows in set (0.00 sec)
mysql> source lab.sql
```

#### lab.sql is an sql dump file

```
DROP SCHEMA IF EXISTS lab;
CREATE SCHEMA lab;
USE lab;
Drop TABLE IF EXISTS people;
CREATE TABLE people (
 `Name` varchar(50),
  `Age` INT default NULL,
  `Mobile` varchar(50) default NULL,
 PRIMARY KEY (`Name`)
);
INSERT INTO people (`Name`, `Age`,
`Mobile`) VALUES
('Al Turing', 32, '443-253-3863'),
('Don Knuth', 25, '410-228-6282'),
('Chuck Babbage', 38, '410-499-1282');
```

### A simple database

```
mysql> use lab; show tables;
_____+
 Tables in lab
people
+----+
mysql> desc people;
+----+
Name | varchar(50) | NO | PRI |
| Mobile | varchar(50) | YES | NULL
 mysql> select * from people;
 _____+
 Name | Age | Mobile
Al Turing | 32 | 443-253-3863 |
 Don Knuth | 25 | 410-228-6282 |
 Chuck Babbage | 38 | 410-499-1282 |
 ----+
```

### The default model

- The people table has info of things of type people
   <a href="http://ebiq.org/o/labvocab/resource/people">http://ebiq.org/o/labvocab/resource/people</a>>
- Each row in the table has information about one instance of a person
- The first column is the key and is used both
  - As the identifier for a person instance <a href="http://localhost/people/Chuck\_Babbage">http://localhost/people/Chuck\_Babbage</a>>
  - For the rdf:label for a person instance
- Properties of a person are: name, age & mobile
   <a href="http://ebiq.org/o/labvocab/resource/people\_Age">http://ebiq.org/o/labvocab/resource/people\_Age</a>

### **Generating RDF mappings**

- D2RQ generates a default mapping directly from the database
  - % d2rq/generate-mapping –u demo –w3c \
    -o lab\_map.ttl jdbc:mysql://127.0.0.1/lab
  - -u arg: user for database access
  - o arg: file to write mapping to
  - --w3c flag: use W3C compatible mapping format
  - Last arg: string JDBC uses to access database table
- Resulting mapping can be edited as desired

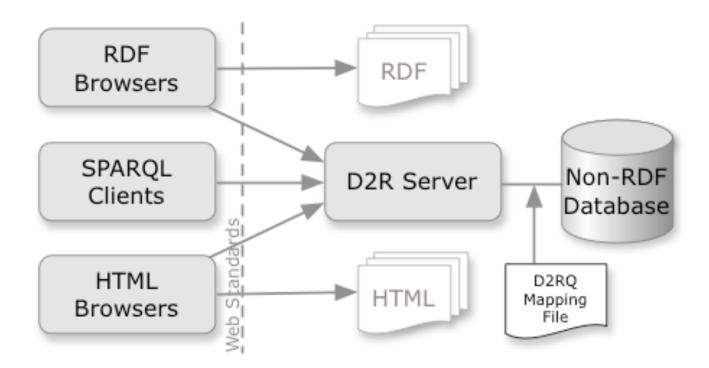

### The Default D2RQ mapping

```
@prefix ...
Map:database a d2rq:Database;
 d2rg:jdbcDriver "com.mysql.jdbc.Driver";
 d2rq:jdbcDSN "jdbc:mysql://127.0.0.1/lab";
 d2rq:username "demo";
 jdbc:autoReconnect "true";
 jdbc:zeroDateTimeBehavior "convertToNull"; .
map:people a d2rq:ClassMap;
 d2rg:dataStorage map:database;
 d2rq:uriPattern "people/@@people.Name|
urlify@@";
 d2rg:class vocab:people;
 d2rq:classDefinitionLabel "people"; .
map:people__label a d2rq:PropertyBridge;
 d2rg:belongsToClassMap map:people;
 d2rq:property rdfs:label;
 d2rq:pattern "people #@@people.Name@@";.
```

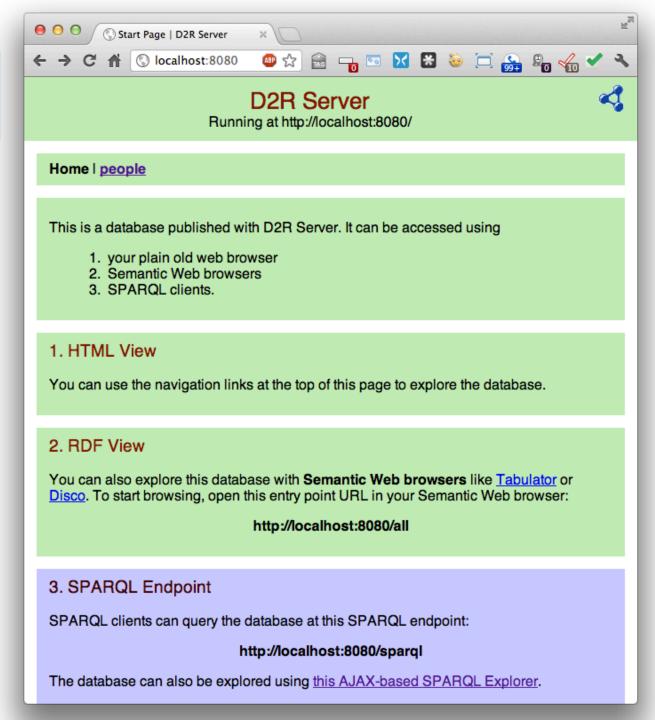

```
map:people Name a d2rq:PropertyBridge;
 d2rg:belongsToClassMap map:people;
 d2rq:property vocab:people Name;
 d2rq:propertyDefinitionLabel "people Name";
 d2rq:column "people.Name"; .
map:people Age a d2rq:PropertyBridge;
 d2rq:belongsToClassMap map:people;
 d2rg:property vocab:people Age;
 d2rq:propertyDefinitionLabel "people Age";
 d2rg:column "people.Age";
 d2rq:datatype xsd:int; .
map:people Mobile a d2rq:PropertyBridge;
 d2rq:belongsToClassMap map:people;
 d2rq:property vocab:people_Mobile;
 d2rq:propertyDefinitionLabel "people Mobile";
 d2rq:column "people.Mobile"; .
```

### **D2r Server**

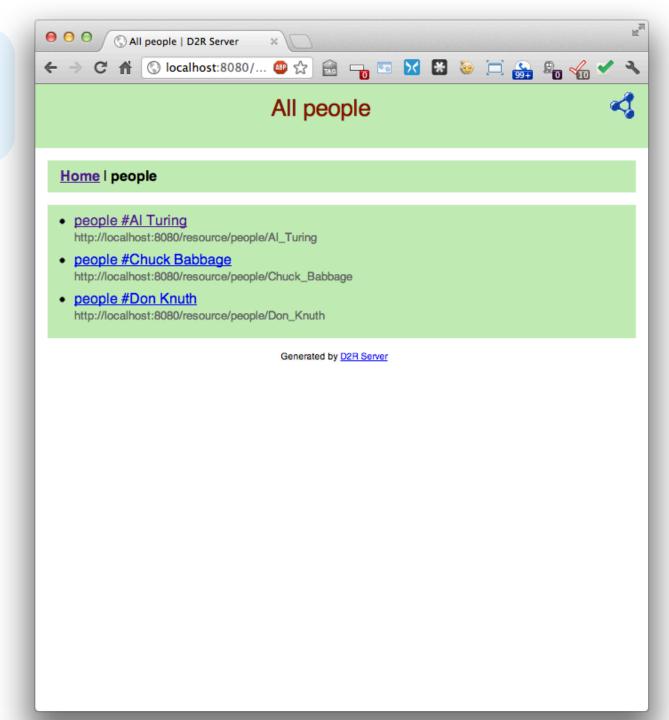

- The d2r-server provides real-time access to rdf data via several protocols
  - d2r-server -port 8081 ../lab\_map.ttl

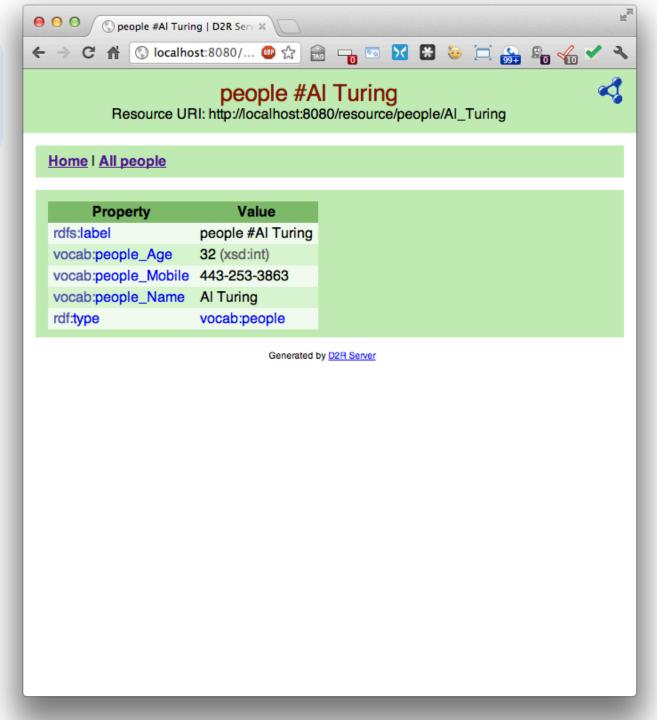

- Explore via HTML
- Via SPARQL endpoint

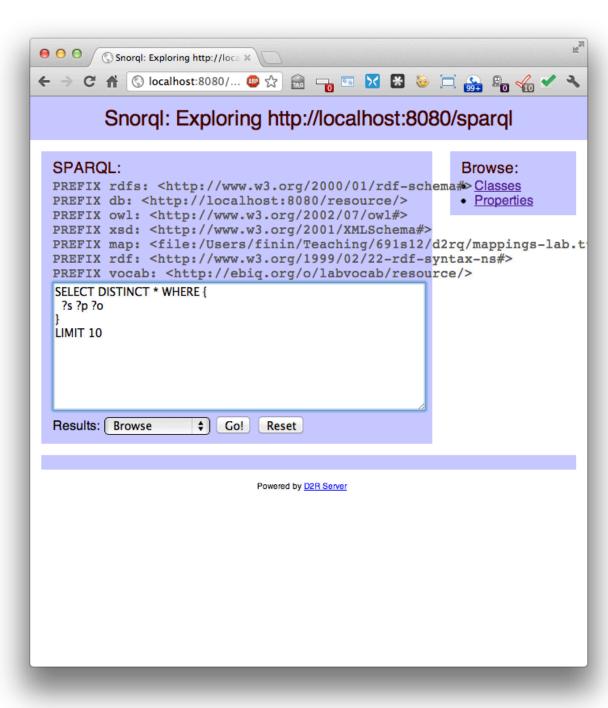

- Explore via HTML
- Via SPARQL endpoint

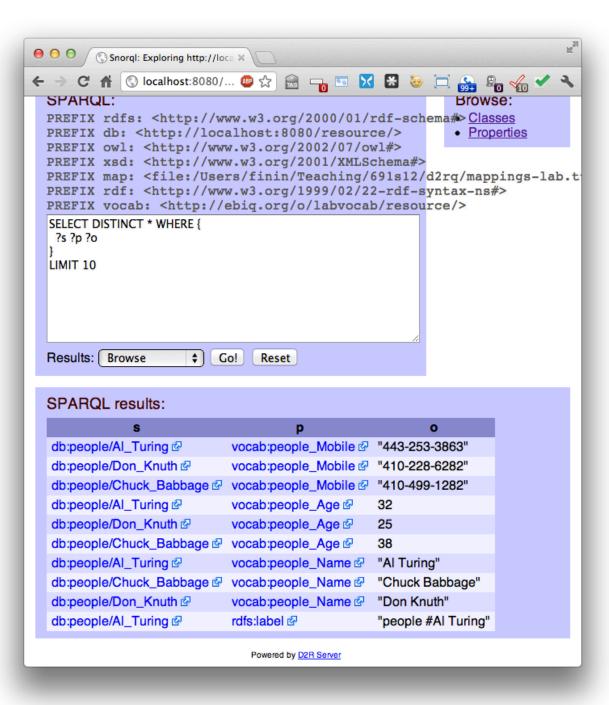

- Explore via HTML
- Via SPARQL endpoint

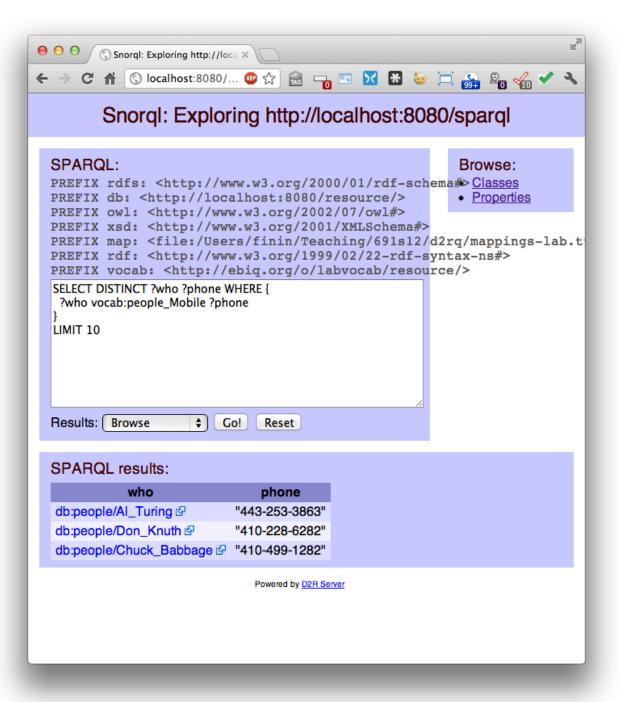

Via SPARQL endpoint

Via SPARQL endpoint

Via SPARQL endpoint

### **Generating RDF dumps**

Once mapping is defined, use dump-rdf for RDF dumps in various formats, e.g.:

```
% dump-rdf --w3c -o ../lab.ttl \
-f TURTLE ../lab_map.ttl
```

# **Generating RDF dumps**

```
@prefix rdf:
                <a href="http://www.w3.org/1999/02/22-rdf-syntax-ns#">http://www.w3.org/1999/02/22-rdf-syntax-ns#</a> .
@prefix vocab: <file:///Users/finin/Sites/691f16/examples/d2rq/vocab/> .
@prefix map:
                  <file:///Users/finin/Sites/691f16/examples/d2rq/lab.ttl#> .
@prefix db:
                <file:///Users/finin/Sites/691f16/examples/d2rg/lab.ttl> .
vocab:people_Name a rdf:Property ;
    rdfs:label "people Name".
db:l#people/Al Turing> a vocab:people;
    rdfs:label "people #Al Turing";
    vocab:people Age 32;
    vocab:people Mobile "443-253-3863";
    vocab:people Name "Al Turing".
```

### **Content Negotiation**

- D2RQ automatically recognizes URIs for
  - Entities (e.g., an RDF object like a class or instance)
     http://localhost:8080/resource/people/Al\_Turing
  - RDF representations
     http://localhost:8080/data/people/Al\_Turing
  - HTML representations http://localhost:8080/page/people/Al\_Turing
- The HTTP protocol supports content negotiation
- A get request can specify what kind of content it wants, e.g., HTML or RDF

### Resources and 303 redirects

- Asking for raw resource make no sense it's just an identifier
- Client specifies in HTTP header the kind of content desired, e.g. HTML or RDF
- Server responds with an <u>303 redirect</u> indicating where to go
- When client gets the 303 response, it asks for new URL

### Resources and 303 redirects

% curl -H "Accept: text/html" http://localhost:8081/resource/people/Al\_Turing

303 See Other: For a description of this item, see

http://localhost:8081/page/people/Al\_Turing

% curl -H "Accept: application/rdf+xml" <a href="http://localhost:8081/resource/people/Al\_Turing">http://localhost:8081/resource/people/Al\_Turing</a>

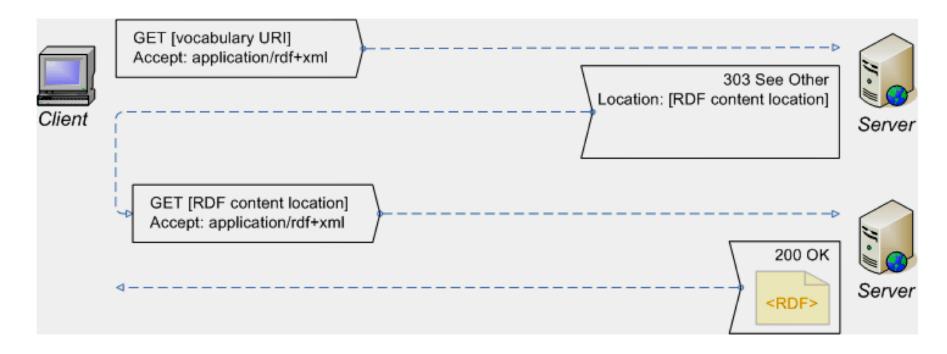

303 See Other: For a description of this item, see

http://localhost:8081/data/people/Al\_Turing

### URIs should be de-referenceable

Linked Data best practice says that URIs should be dereferenceable;

Doing a GET on one should always yield **useful information** 

# **Asking for RDF data**

### % curl http://localhost:8081/data/people/Al Turing @prefix rdfs: <a href="http://www.w3.org/2000/01/rdf-schema">http://www.w3.org/2000/01/rdf-schema#> . . . . @prefix vocab: <a href="http://ebiq.org/o/labvocab/resource/">http://ebiq.org/o/labvocab/resource/</a>. <a href="http://localhost:8080/data/people/Al\_Turing">http://localhost:8080/data/people/Al\_Turing</a> rdfs:label "RDF Description of people #Al Turing"; foaf:primaryTopic <a href="http://localhost:8080/resource/people/Al\_Turing">http://localhost:8080/resource/people/Al\_Turing</a> . vocab:people rdfs:seeAlso <a href="http://localhost:8080/sparql?query=DESCRIBE+%3Chttp%3A">http://localhost:8080/sparql?query=DESCRIBE+%3Chttp%3A</a> %2F%2Febiq.org%2Fo%2Flabvocab%2Fresource%2Fpeople%3E>. <a href="http://localhost:8080/resource/people/Al">http://localhost:8080/resource/people/Al</a> Turing> vocab:people; rdfs:label "people #Al Turing"; vocab:people\_Age "32"^^xsd:int ; vocab:people\_Mobile "443-253-3863"; vocab:people Name "Al Turing".

# **Asking for HTML**

#### % curl http://localhost:8081/page/people/Al\_Turing

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN" "http://</pre>
www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<a href="http://www.w3.org/1999/xhtml" xml:lang="en" lang="en">
 <head>
  <title> people #Al Turing | D2R Server </title>
  <link rel="stylesheet" type="text/css" href="http://localhost:8080/snorql/</pre>
style.css" />
  <link rel="alternate" type="application/rdf+xml" href="http://localhost:8080/</pre>
data/people/Al_Turing?output=rdfxml" title="This page in RDF (XML)" />
  <link rel="alternate" type="text/rdf+n3" href="http://localhost:8080/data/people/</pre>
Al Turing?output=n3" title="This page in RDF (N3)" />
 </head>
```

### ISWC database example

- D2RQ comes with a partial example database and mapping for information about the first ISWC conference
- To run:
  - d2r-server -port 8082 ../iswc\_map.ttl
  - Visit http://localhist:8082/

Home | conferences organizations papers persons rel paper topic rel person organization rel person paper rel person topic topics

This is a database published with D2R Server. It can be accessed using

- 1. your plain old web browser
- 2. Semantic Web browsers
- 3. SPARQL clients.

#### 1. HTML View

You can use the navigation links at the top of this page to explore the database.

#### 2. RDF View

You can also explore this database with **Semantic Web browsers** like <u>Disco</u> or <u>Marbles</u>. To start browsing, open this entry point URL in your Semantic Web browser:

http://localhost:8082/all

#### 3. SPARQL Endpoint

SPARQL clients can query the database at this SPARQL endpoint:

http://localhost:8082/sparql

### **ISWC** Database

- Information about several conferences
- It's richer schema
   goes beyond a simple
   auto generated
   mapping
- This shows how to install on your computer and some sample queries

```
mysql> use iswc; show tables;
  Tables in iswc
  conferences
  organizations
  papers
  persons
  rel paper topic
  rel_person_organization
  rel person paper
  rel_person_topic
  topics
9 rows in set (0.00 sec)
```
